SECTION A- READING (20 marks)

Q1. Read the following passage.

(8 marks)

Renewable energy is energy that comes from natural sources that can be replenished, such as sunlight, wind, water, and geothermal heat. Unlike fossil fuels like coal and oil, renewable energy sources do not pollute the environment. They are cleaner and better for the planet.

Solar energy, for example, uses sunlight to produce electricity. It is captured using solar panels, which are installed on rooftops or in large solar farms. Wind energy uses wind turbines to generate electricity. These turbines are often found in open areas or offshore, where the wind is strong.

Hydropower is another important form of renewable energy. It uses the flow of water, such as rivers or dams, to produce electricity. Geothermal energy, on the other hand, uses heat from beneath the Earth's surface to generate power.

One of the main challenges of renewable energy is that it depends on nature. For example, solar panels cannot produce electricity at night, and wind turbines need strong winds to work efficiently. Despite these challenges, renewable energy is a key solution to reducing pollution and fighting climate change.

The Discovery of Penicillin

In 1928, a scientist named Alexander Fleming made a discovery that changed the world of medicine forever. He was studying bacteria in his laboratory when he noticed something unusual. A mold called Penicillium had accidentally grown on one of his petri dishes and killed the bacteria around it. This was the beginning of penicillin, the world's first antibiotic.

Penicillin could kill harmful bacteria without harming the patient, making it a breakthrough in treating infections. Before its discovery, many people died from simple infections like cuts or sore throats. During World War II, penicillin saved thousands of lives by treating infected wounds and illnesses.

Although Fleming made the initial discovery, other scientists worked hard to turn penicillin into a medicine that could be produced on a large scale. Today, antibiotics are widely used to treat bacterial infections, but scientists remind us not to overuse them, as bacteria can become resistant.

These mental challenges can help sharpen the mind and improve different aspects of intelligence.

2. Games like chess, for example, require players to think ahead and plan their moves carefully. Chess helps improve logical thinking, memory, and strategy. Players need to think several moves ahead, not only their own but of their opponent's possible moves also. This helps develop problem-solving skills and enhances creativity. Other games, such as puzzles or Sudoku, also work the brain by encouraging pattern recognition, attention to detail, and focus.

Bats look like a small brown mouse. They have a fox-like muzzle, large ears and a neck, which is short and well covered with fur. They are flying mammals. They can fly but they are not birds. They do not have feathers on their wings like birds. Instead they have double layers of skin stretched over their bones.

There are nearly a thousand different kinds of bats which vary in size. The largest bat has been recorded as having a wing span over 150 cm. But most bats are small creatures with rather large wings. A vampire bat's body is only 9 cm long with a wing span of up to 18 cm. Most bats are nocturnal creatures, which means they are active only at night. They sleep during the day and come out only in search of food.

Bats hang upside down by their feet when they rest or sleep. They often live in caves where there may be thousands of them crowded together on the walls and ceiling. Smaller bat colonies of up to twelve bats may live together inside a hollow cave. They sleep close together for warmth.

Most bats live on insects and help in pest control. Some of them eat fruits and flowers also. Vampire bats feed on blood. They use their sharp teeth and tube-like tongue to suck animals' blood. These bats are dangerous to human beings and domestic animals. Bats have sensitive ears which help them to locate their prey as well as obstacles. The high-pitched squeaks made

by bats produce echoes. They catch these echoes and are able to make a sound picture of what is around them. They do not need to use their eyes much. 'As blind as bat' is a common usage but it is not true to say that bats are totally blind.

Garbage is a great environment hazard. It comes from various sources- used paper, tiffin packaging, plastic bags, ice-cream wrappers, bottle caps, fallen leaves from trees and many more. Garbage makes the premises ugly, unkempt and breeds diseases. A lot of trash that is thrown away contains material that can be recycled and reused such as paper, metals and glass which can be sent to the nearest recycling centre or disposed off to the junk dealer. It also contains organic matter such as leaves which can enrich soil fertility. A compost pit can be made at convenient location where the refuse can be placed with layers of soil and an occasional sprinkling of water. This would help decomposition to make valuable fertilisers. This would also prevent pollution that is usually caused by burning such organic waste.

वायु-प्रदूषण का सबसे अधिक प्रकोप महानगरों पर हुआ है। इसका कारण है - बढ़ता हुआ औद्योगीकरण। गत बीस वर्षों में भारत के प्रत्येक नगरों में कारखानों की जितनी तेज़ी से वृद्धि हुई है, उससे वायु मंडल पर बहुत बुरा प्रभाव पड़ा है क्योंकि इन कारखानों में चिमनियों से चौबीसों घंटे निकलने वाले धुएँ ने सारे वातावरण को विषाक्त बना दिया है। इसके अलावा सड़कों पर चलने वाले वाहनों की संख्या में तेज़ी से होने वाली वृद्धि भी वायु-प्रदूषण के लिए पूरी तरह उत्तरदायी है। इन वाहनों के धुएँ से निकलने वाली 'कार्बन मोनोऑक्साइड गैस' के कारण आज न जाने कितने प्रकार की साँस और फेफड़ों की बीमारियाँ आम बात हो गई हैं। इधर बढ़ती हुई जनसंख्या, लोगों का काम की तलाश में गाँवों से शहरों की ओर भागना भी वायु-प्रदूषण के लिए अप्रत्यक्ष रूप से उत्तरदायी है। शहरों की बढ़ती जनसंख्या के लिए आवास की सुविधाएँ उपलब्ध करने के लिए वृक्षों और वनों को भी निरंतर काटा जा रहा है। अतः हमें पर्यावरण की सुरक्षा के लिए अधिक से अधिक वृक्ष लगाने चाहिए।

If the temperature drops, the water vapour cools down and forms water droplets, which we see as condensation on surfaces. When ice is placed at room temperature, it starts to melt and turns into liquid water. This process shows how water can move through different states-solid, liquid, and gas-based on the surrounding temperature.

Rainwater harvesting is the process of collecting and storing rainwater for future use. This ancient practice is gaining popularity worldwide as a sustainable solution to water scarcity. Rainwater harvesting systems typically consist of a collection surface, such as a rooftop and a storage tank. The collected rainwater can be used for various purposes, including irrigation, toilet flushing, and even drinking water. Rainwater harvesting helps reduce storm water runoff, alleviate pressure on groundwater resources, and decrease the demand on municipal water supplies. It also reduces the amount of pollutants entering waterways and decreases the risk of flooding. Additionally, rainwater harvesting can help reduce energy consumption

and lower water bills. Overall, rain water harvesting is a simple yet effective way to conserve water and promote sustainability.

CASE BASED QUESTIONS (3X4=12M)

30. With over 1.4 billion inhabitants (about 18 percent of the world's population), such diversity is not surprising! In the late 20th century, the Anthropological Survey of India, a national organisation, conducted a massive survey called 'People of India project' of 4,635

communities across all States of the country. It counted 325 languages using 25 scripts; it also observed that many Indians may be called migrants, in the sense of people not living near their birthplace or with their original community. What is meant by ‘unity in diversity’? How shall we perceive and express this unity, or the ‘Many in the One’? To answer this question, we will explore a few dimensions of Indian life.

1. What is the population of India?

- a) 1.4 million b) 1.4 billion c) 1.2 billion d) 1.5 billion

2. Anthropological Survey of India conducted a massive survey called _____

- a) Unity in diversity b) India project c) people of India project d) Unity project

3. How many languages were counted by the Anthropological survey of India?

- a) 333 b) 25 c) 4635 d) 325

4. What is meant by ‘unity in diversity’?

- a) Many in the one b) One in many c) Many in many d) One in one.

31. Relationships among family members are based on love, care, cooperation and interdependence. ‘Cooperation’ means ‘working together’. Each member of the family has a role and responsibility towards other members. For instance, parents are responsible for raising their children to become happy individuals and responsible members of the society. But also, as children grow up, they take on more responsibilities in the home to help other family members — whether parents or a sister or a brother, etc. Following our dharma, or doing our duty, has been an important principle of Indian culture. The family is also a ‘school’, where children learn important values. Families are connected not only within themselves, but also with other families and the people around them. Such a group of connected people may be called a ‘community’ (there are other meanings for ‘community’, depending on the context). Members of a community come together for various reasons, like celebrating festivals and organising feasts, weddings and other events.
