

CHAPTER – 5

LINES AND ANGLES (HAND OUT)

Module- $\frac{2}{3}$

INTRODUCTION:

In the previous module we learnt about the angle. In this module we learn more about the angles.

ADJACENT ANGLES –

A pair of angles are called adjacent angles if-

- (a) they have a common vertex.
- (b) they have a common arm.
- (c) the non-common arms are on either side of the common arm.

$\angle ADB$ and $\angle BDC$ are adjacent angles, because the common vertex is D, common arm is BD and the non-common arms AD and CD lie on opposite sides of the common arm.

$\angle ADB$ and $\angle ADC$ are not adjacent angles, because the common vertex is D, common arm is AD and the non-common arms BD and CD lie on same sides of the common arm AD.

LINEAR PAIR ANGLES –

A pair of adjacent angles are said to be linear pair, if the non- common arms form opposite rays.

Example-1 A

$\angle ACB$ and $\angle ACD$ are linear pair, as the non-common arms form opposite rays.

Linear pair angles are supplementary. (Their sum is 180°)

Example-2

$\angle PSQ$ and $\angle QSR$ are not linear pair, as the non-common arms do not form opposite rays.

Example-3

$\angle ACB$ and $\angle ACD$ are linear pair, $\angle ACB = (2x+8)^\circ$ and $\angle ACD = (x-2)^\circ$. Find x

$$\angle ACB + \angle ACD = 180^\circ \text{ (Linear pair)}$$

$$\text{Or, } 2x + 8^\circ + x - 2 = 180^\circ$$

$$\text{Or, } 3x + 6^\circ = 180^\circ$$

$$\text{Or, } 3x = 180^\circ - 6^\circ = 174^\circ$$

$$\text{Or, } x = \frac{174}{3} = 58^\circ$$

$$\angle ACB = 2x + 8 = 2 \times 58 + 8 = 116 + 8 = 124^\circ$$

$$\angle ACD = x - 2 = 58 - 2 = 56^\circ$$

VERTICALLY OPPOSITE ANGLES -

If two line segments or lines intersect with each other, then a pair of angles are said to be vertically opposite angles, if they have a common vertex and no common arm.

$\angle 1$ and $\angle 3$. $\angle 2$ and $\angle 4$ are vertically opposite angles.

If two lines intersect with each other, then the vertically opposite angles are equal. so, $\angle 1 = \angle 3$ and $\angle 2 = \angle 4$

Proof- $\angle 1 + \angle 4 = 180^\circ$ (linear pair)

$$\text{Or, } \angle 1 = 180^\circ - \angle 4 \quad (\text{i})$$

$$\angle 4 + \angle 3 = 180^\circ \quad (\text{linear pair})$$

$$\text{Or, } \angle 3 = 180^\circ - \angle 4 \quad (\text{ii})$$

By (i) and (ii)

$$\angle 1 = \angle 3$$

$$\text{Similarly } \angle 2 = \angle 4$$

Example-1.

If $\angle AOC = 30^\circ$ find the other angles.

$$\angle AOB = \angle COD \quad (\text{Vertically opposite angles})$$

$$30^\circ = \angle COD$$

$$\angle AOC + \angle AOB = 180^\circ \quad (\text{Linear pair})$$

$$\angle AOC + 30^\circ = 180^\circ$$

$$\angle AOC = 180^\circ - 30^\circ = 50^\circ$$

$$\angle AOC = \angle BOD \quad (\text{Vertically opposite angles})$$

$$50^\circ = \angle BOD$$

Example2-

If $\angle AOC = 68^\circ$ and $\angle BOD = 70^\circ$, then find $\angle COD$.

$$\angle AOC + \angle COD + \angle BOD = 180^\circ \quad (\text{Straight angle})$$

$$68^\circ + \angle COD + 70^\circ = 180^\circ$$

$$\angle COD + 138^\circ = 180^\circ$$

$$\angle COD = 180^\circ - 138^\circ = 42^\circ$$

What we have learnt –

(a) Adjacent angles- A pair of angles having a common vertex, a common arm and non-common arms lie on opposite sides of common arm.

(b) Linear pair- A pair of adjacent angles in which the non-common arms form opposite rays.

(c) Vertically opposite angles - If two line segments or lines intersect with each other, then a pair of angles are said to be vertically opposite angles, if they have a common vertex and no common arm.

ASSIGNMENTS -

Q1.Name all the adjacent angles-

Q2.Fill in the blanks-

- (a) The measure of a linear pair angles is -----.
- (b) An adjacent pair of angles have a common ----- and a common -----.
- (c) In a linear pair angles, the non-common arms form opposite -----.
- (d) One of the angles of a linear pair is 45° , and then the measure of other angle is -----.
- (e) A ----- is common in vertically opposite angles.

Q3. If $(5x - 1)^\circ$ and $(5x - 19)^\circ$ form a linear pair, then find the value of x.

Q4. In the fig. BO is perpendicular to CD, then name-

- (i) two linear pairs. (ii) two pairs of vertically opposite angles (iii) three pairs of adjacent angles
- (iv) one pair of complementary angles (vi) one pair of supplementary angles.

Q5. Look at the following figures and fill in the blanks –

(i)

$\angle x = \text{-----}$

(ii)

$\angle p = \text{-----}$

(iii)

Complement of $\angle ABC = \text{-----}$

(IV)

Supplement of $\angle POQ = \text{-----}$
